

Introduction to Artificial Intelligence

Master on Internet of Things & Data Analytics

Tuesdays and Wednesdays

Héctor García de Marina: hgarciad@ucm.es

What is Artificial Intelligence?

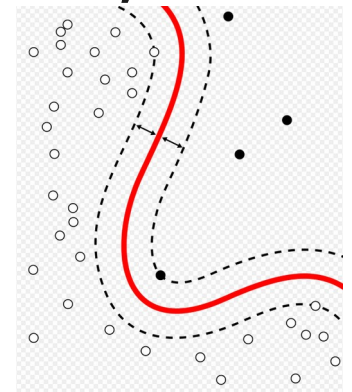

- There is no agreement on a universal definition
- "Set of algorithms, mostly HEURISTIC, focused on: *Reasoning, knowledge representation, planning, learning, natural language processing, and perception*"
- Heuristic: Practical method with no guarantees but it is good enough most of the times for the user
- Bio-inspired algorithms: They *mimic* human intelligence (whatever that means)

Objectives of this course

- Introduce you to AI techniques from a practical point of view.
- Still, some mathematical knowledge is required.
 - Basics on algebra, calculus, and statistics.

Machine learning

- ML is the study of computer algorithms that can improve automatically through the experience and by the use of data.
- Examples: Email filtering, Speech recognition, Computer vision.
- Supervised learning: The set of data contains both, the inputs and the desired outputs (support-vector machines, neural networks)

Machine learning

- Unsupervised learning: Algorithms that find patterns from untagged data. (deep learning can be unsupervised).

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
2 2 2 2 2 2 2 2 2 2 2 2 2 2 2
3 3 3 3 3 3 3 3 3 3 3 3 3 3 3
4 4 4 4 4 4 4 4 4 4 4 4 4 4 4
5 5 5 5 5 5 5 5 5 5 5 5 5 5 5
6 6 6 6 6 6 6 6 6 6 6 6 6 6 6
7 7 7 7 7 7 7 7 7 7 7 7 7 7 7
8 8 8 8 8 8 8 8 8 8 8 8 8 8 8
9 9 9 9 9 9 9 9 9 9 9 9 9 9 9

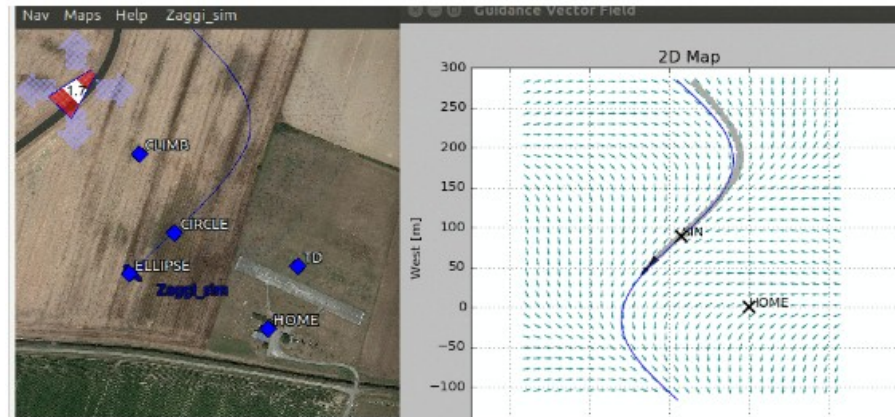

Genetic algorithms

- Good at generating a broad class of solutions to a problem.

Robotics

- Planning and path following

Tomorrow math recap

- We will review some basis on Algebra and Calculus, and its implementation in Python.

Evaluation

- Series of short quizzes on the topics
- Final project in groups (last 4 sessions) with the learned techniques
